"Death is the midnight runner.” – Arab proverb Higgins’ last novel, Edge of Danger, was “hugely entertaining,” said the Los Angeles Times. “The publisher describes it as a powerful thriller, and it’s no lie.” At its end, the murderous Arab/English Rashid family lay decimated – but not extinct. And that may have been Sean Dillon’s fatal error. Her brothers killed one by one, Kate Rashid swears vengeance on all who have harmed her family. Never mind that they tried to assassinate the President of the United States, that villainy ran in their veins. They were her brothers, and her enemies would pay. British agent Sean Dillon…White House operative Blake Johnson…the President himself…their time was coming, and only she knew how – or when. Brilliantly suspenseful, Midnight Runner is further proof that, in the words of the Associated Press, “when it comes to thriller writers, one name stands well above the crowd – Jack Higgins.”

Like most technical disciplines, environmental science and engineering is becoming increasingly specialized. As industry professionals focus on specific environmental subjects they become less familiar with environmental problems and solutions outside their area of expertise. This situation is compounded by the fact that many environmental science related terms are confusing. Prefixes such as bio-, enviro-, hydra-, and hydro- are used so frequently that it is often hard to tell the words apart. The Environmental Engineering Dictionary and Directory gives you a complete list of brand terms, brand names, and trademarks - right at your fingertips.
Keeping in view the limited time at the disposal of engineering students preparing for university examination, the book contains fairly large number of solved examples taken from various recent examination papers of different universities and Engineering colleges so that they may not find any difficulty while answering these problems in their final examination. Latest question papers up to summer 2006 of A.M.I.E. have been added for the readers to understand the latest trend.

The purpose of this manual is to present basic principles used in the design and construction of earth levees. The term levee as used herein is defined as an embankment whose primary purpose is to furnish flood protection from seasonal high water and which is therefore subject to water loading for periods of only a few days or weeks a year. Embankments that are subject to water loading for prolonged periods (longer than normal flood protection requirements) or permanently should be designed in accordance with earth dam criteria rather than the levee criteria given herein. Even though levees are similar to small earth dams they differ from earth dams in the following important respects: (a) a levee embankment may become saturated for only a short period of time beyond the limit of capillary saturation. (b) levee alignment is dictated primarily by flood protection requirements, which often results in construction on poor foundations, and (c) borrow is generally obtained from shallow pits or from channels excavated adjacent to the levee, which produce fill material that is often heterogeneous and far from ideal. Selection of the levee section is often based on the properties of the poorest material that must be used.
